#### **DETAILED ACTION**

### Response to Amendment

1. Examiner acknowledges receipt of the preliminary amendment, filed 2/26/01.

# Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claims 1-20 are rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter.

Claims 1 and 15 are drawn to a mathematical algorithm, per se. Claims to processes that do nothing more than solve mathematical problems or manipulate abstract ideas or concepts are non-statutory. If the "acts" of a claimed process manipulate only numbers, abstract concepts or ideas, or signals representing all of the foregoing, the acts are not being applied to appropriate subject matter. Schrader, 22 F.3d at 294-95, 30 USPQ2d at 1458-59. Thus, a process consisting solely of mathematical operations without some claimed practical application is drawn to non-statutory subject matter. In this case, the claims merely recite the steps of producing an input finite-state network, creating a first temporary finite-state network, creating a second temporary finite-state network, computing the cross product of the first temporary finite-state network and producing an output finite state network, without any practical application being recited.

Art Unit: 2655

# Allowable Subject Matter

3. Claims 1 and 15 would be allowable if rewritten or amended to overcome the rejection(s) under 35 U.S.C. 101, set forth in this Office action.

- 4. The following is a statement of reasons for the indication of allowable subject matter: Claims 1 and 15 recite the combination of producing an input finite state network that has a set of paths with at least one of those paths containing a delimited subpath where the delimited subpath encodes on an indicated side a delimited substring formatted as a regular expression, creating a first temporary finite-state network by extracting the delimited subpath from the input finite state network and eliminating the symbols on the indicated side of the delimited subpath, creating a second temporary finite state network by compiling the delimited substring formatted as a regular expression, computing the cross product between the first and second temporary finite state networks to produce a resulting finite-state network that is used to replace the delimited substring in the input finite-state network to produce an output finite-state network.
- 5. Kempe (PCT Pub. WO 99/01828) teaches compiling finite state transducers for speech by providing an incomplete set of class sequences, tagging the class sequences using a HMM to produce a tag sequence of a first type, providing a set of tag sequences of a second type and combining the two sets of tag sequences to build a FST (claim 5).
- 6. Chung et al. (U.S. Pat. 6,278,973) teaches a method of on-demand finite-state automata composition that supports creating new networks from an initial network by

Application/Control Number: 09/737,942 Page 4

Art Unit: 2655

combining network machines or creating arcs between unconnected states (col. 7, line 44 to col. 8, lines 31).

- 7. Kiraz ("Multitiered Nonlinear Morphology Using Multitage Finite Automata: A Case Study on Syria and Arabic"), cited by the applicant, teaches creating a finite state network for each entry in a lexicon and computing the cross product of all the finite state networks to create a finite state network for the entire lexicon (section 4.1, page 86).
- 8. It would not have been obvious to one of ordinary skill in the art at the time of invention to modify the systems of Kempe, Chung and Kiraz to arrive at the applicant's invention.
- 9. Claims 2-14 and 16-20 would be allowable because they further limit the claims to which they refer.

#### Conclusion

10. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Karttunen ("The Replace Operator"), Kempe et al. ("Parallel Replacement in Finite State Calculus") and Karttunen (U.S. Pat. 6,023,760) teach compiling finite-state networks from regular expression rules. Mohri (U.S. Pat. 6,032,111) teaches computing finite-state networks for rewriting input speech. Roche (Factorization of Finite-State Transducers") teaches factoring FSTs in order to simplify the searching procedure.
